MEASURING OUT COME

FACILITATE THE GAME

This game is based on Evidence Based Management (EBM). EBM is an empirical framework organizations can use to help measure the (perceived) product value, and the way they deliver their product(s). The measurements can be inspected to help maximize product value and improve the way of working.

- As a Scrum Facilitator, put the four Key Value Areas (KVAs) in a row on the floor (Current Value, Time to Market, Ability to Innovate and Unrealized Value). Explain each KVA to the participants.
- 2. Form two groups and hand one group the green Key Value Measures cards (KVMs) and the other group the remaining purple KVMs.
- Step 1: Invite the group(s) to discuss and put the KVMs under the correct KVA.
- Step 2: Invite both groups to discuss their results and adapt their cards. Make sure by the end of this round, the KVM cards are under the correct KVA.
- 5. Step 3: Invite the participants to individually look at the KVMs and select one KVM that caught their attention. (A non-EBM KVM may also be chosen at this point)
- 6. Step 4: Invite the participants into groups of four. Ask each participant to explain why they chose their particular KVM and collaborate on how to implement it. (In case of non-EBM measures, pay attention that these are not vanity metrics and discuss the potential pitfalls)

Scrum Facilitators is a Dutch-based training organization on a mission to help professionals become awesome Scrum facilitators. A Scrum Facilitator can be a Scrum Master, Product Owner, developer or leader. Great Scrum Facilitators understand the Scrum values & principles and use these to effectively implement Scrum with their teams and organizations.

Scrum Facilitators is a Scrum.org partner. Our classes are accredited, always up-to-date, fun, super interactive and always facilitated by two trainers to maximize your learning objectives. Our trainers are seasoned experts and Scrum.org certified Professional Scrum Trainers with substantial real life experience in various settings.

Based on the 2020 EBM Guide. Learn about Evidence-Based Management (EBM) at http://scrum.org/EBM

CURRENT VALUE

The value that the product delivers today

UNREALIZED VALUE

The potential future value that *could be* realized if the organization met the needs of all potential customers or users

TIME TO MARKET

The organization's ability to quickly deliver new capabilities, services, or products

ABILITY TO INNOVATE

The effectiveness of an organization to deliver new capabilities that might better meet customer needs

Customer Satisfaction

Defect Trends

Product Cost Ratio

Change Failure Rate

Installed Version Index

Desired Customer Experience or satisfaction

Time to remove Impediment

Build & Integration Frequency

Time to Pivot

Production Incident Count

Release Stabilization Period

Lead Time for Changes •••

Market Share

Customer Cycle Time

Time-to-Learn

Employee Satisfaction

Customer Usage Index

Revenue per Employee

Release Frequency

Mean Time to Repair

Lead Time

Innovation Rate

On-Product Index

Deployment Frequency

Technical Debt

Time to Restore Service

Active (Product) Code Branches

Time Spent Merging Code Between Branches

Time Spent Context-Switching

Customer or User Satisfaction Gap

Don't measure Output. Measure Outcomes

It's not about the Metrics, but about the Conversation

EBM Example Key Value Measures cheat sheet

Current Value (CV)		Time-to-Market (T2M)		Ability to Innovat	te (A2I)
KVM	Measuring:	KVM	Measuring:	KVM	Measuring:
Revenue per Employee	The ratio (gross revenue / # of employees) is a key competitive indicator within an industry. This varies significantly by industry.	Build and Integration Frequency	The number of integrated and tested builds per time period. For a team that is releasing frequently or continuously, this measure is superseded by actual release measures.	Innovation Rate	The percentage of effort or cost spent on new product capabilities, divided by total product effort or cost. This provides insight into the capacity of the organization to deliver new product capabilities.
Product Cost Ratio	Total expenses and costs for the product(s)/system(s) being measured, including operational costs compared to revenue.	Release Frequency	The number of releases per time period, e.g. continuously, daily, weekly, monthly, quarterly, etc. This helps reflect the time needed	Defect Trends	Measurement of change in defects since last measurement. A defect is
Employee Satisfaction	Some form of sentiment analysis to help gauge employee engagement, energy, and enthusiasm.		to satisfy the customer with new and competitive products.		anything that reduces the value of the product to a customer, user, or to the organization itself. Defects are generally things that don't work as intended.
Customer Satisfaction	Some form of sentiment analysis to help gauge customer engagement and happiness with the product.	Release Stabilization Period	The time spent correcting product problems between the point the developers say it is ready to release and the point where it is actually released to customers. This helps represent the impact of poor development practices and underlying design and code	On-Product Index	The percentage of time teams spend working on product and value.
Customer Usage Index	Measurement of usage, by feature, to help infer the degree to which customers find the product useful and whether actual usage meets expectations on how long users should be taking with a feature.		base.		
		Mean Time to Repair	The average amount of time it takes from when an error is detected and when it is fixed. This helps reveal the efficiency of an organization to fix an error.	Installed Version Index	The number of versions of a product that are currently being supported. This reflects the effort the organization spends supporting and maintaining older versions of software.
Unrealized Value (UV)	Unrealized Value (UV)		The amount of time from when work starts on a release until the	Technical Debt	A concept in programming that reflects the extra development and testing
KVM	Measuring:	Customer Cycle Time	point where it is actually released. This measure helps reflect an organization's ability to reach its customer.	Todinioai Bobt	work that arises when "quick and dirty" solutions result in later remediation. It creates an undesirable impact on the delivery of value and an avoidable
Market Share	The relative percentage of the market not controlled by the product; the potential market share that the product might achieve if it better met customer needs.	Lead Time	The amount of time from when an idea is proposed, or a hypothesis is formed until a customer can benefit from that idea. This measure may vary based on customer and product. It is a	Production	increase in waste and risk. The number of times in a given period that the Development Team was
Customer or User Satisfaction Gap	The difference between a customer or user's desired experience and their current experience.		contributing factor for customer satisfaction.	Incident Count	interrupted to fix a problem in an installed product. The number and frequency of Production Incidents can help indicate the stability of the product.
Desired Customer Experience or satisfaction	A measure that indicates the experience that the customer would like to have	Lead Time for Changes	The amount of time to go from code-committed to code successfully running in production. For more information, see the DORA 2019 report.	Active Product (Code) Branches	The number of different versions (or variants) of a product or service. Provides insight into the potential impact of change and the resulting complexity of work.
		Deployment Frequency	The number of times that the organization deployed (released) a new version of the product to customers/users. For more information, see the <u>DORA 2019 report</u> .	Time Spent Merging Code	The amount of time spent applying changes across different versions of a product or service. Provides insight into the potential impact of change and
		Time to Restore Service	The amount of time between the start of a service outage and the restoration of full availability of the service. For more information, see the <u>DORA 2019 report</u> .	Between Branches	the resulting complexity of work.
		Time-to-Learn	The total time needed to sketch an idea or improvement, build it, deliver it to users, and learn from their usage.	Time Spent Context-Switching	Examples include time lost to interruptions caused by meetings or calls, time spent switching between tasks, and time lost when team members are interrupted to help people outside the team can give simple insight into the
		Time to remove Impediment	The average amount of time from when an impediment is raised until when it is resolved. It is a contributing factor to lead time and employee satisfaction.	Change Failure	magnitude of the problem. The percentage of released product changes that result in degraded service and require remediation (e.g., hotfix, rollback, patch), For more
		Time to Pivot	A measure of true business agility that presents the elapsed time between when an organization receives feedback or new information and when it responds to that feedback; for example,	Rate	service and require remediation (e.g. notix, rollback, patch). For more information, see the <u>DORA 2019 report</u> .

the time between when it finds out that a competitor has delivered a new market-winning feature to when the organization responds with matching or exceeding new capabilities that measurably

improve customer experience.
